ABSTRACT
Total information access is extremely limited in Nepal and negligible in the rural areas. Only a very small fraction of the country’s residences, businesses, and institutions have access to telecommunication services. Due to the absence of infrastructure and basic services, such as roads, electricity, health care, and clean water, the value of telecommunication services is not perceived in some areas. In addition, the economic losses incurred by the government and private sector in the form of reduced business and services are not easy to measure. For these reasons, the government of Nepal has a national information and communications infrastructure strategy, which is being implemented through a number of projects. The project management of these projects is challenging due to the limited infrastructure and the lack of skilled manpower. The Information and Communication Technology Global Development Alliance (ICT Global) project presents an innovative case study of project management, which can help improve the effectiveness and efficiency of project management in developing countries. The project management approach used in the project is based on the principles of project management and emphasizes the importance of collaboration and communication. The project management approach used in the project is based on the principles of project management and emphasizes the importance of collaboration and communication. The project management approach used in the project is based on the principles of project management and emphasizes the importance of collaboration and communication.
